Heating Load in Passivehouses

Hochschule Rosenheim University of Applied Sciences

"Heizlast im Passivhaus" – Bisanz Fachinformation PHI 1999/2

- International Standards (EN 12831) lead to heating loads, which are 2,5 times the measured values
- Applying dynamical simulation the "real" heating loads for passivehouses were determined
- Influence considered from:
 - Internal heat gains
 - Solar heat gains
 - Response Time of the building
- A simple stationary method for calculating the heating load for passivehouses should be found

Method in PHPP:

- The heating load is calculated for a cold, clear and moderate cold, overcast day
- The maximum of both values is used as heating load
- Transmission heat losses:
 - Calculation under stationary conditions
 - Cold basements are assumed to have 10°C
- Ventilation heat losses
 - □ effective air change rate
 - □ air change rate due to infiltration according to EN 832 is multiplied by 2.5
- Internal heat gains
 - □ in general 1,6 W/m² (for dwellings)
- Solar heat gains
- Local weather conditions: Have to be calculated with dynamical simulation software

Hochschule Rosenheim University of Applied Sciences **Room Heating Systems** Heating with Supply Air Scheme: cross-counterflow heat exchanger outside air exhaust air outgoing air heated supply air RT air heater thermostat Supply air is heated by an air heater □ max. 52 °C □ max. 10 W/m², to avoid dry indoor air Electrical heater or water based heaters available One central air heater is sufficient for a single family house In multifamily buildings one air heater is used for each dwelling Additional heating system for bathrooms

Room Heating Systems Air Heater with Water or Electrical

Heating Systems / 12

Room Heating Systems **Additional Heating Systems**

- Bathrooms should be heated up to 24°C, therefore an additional system is necessary
- Common systems:
 - □ Towel radiator
 - Radiant heater
 - Floor heating system
- A combined time switch thermostat should be used

PTC-Element

Elektrisches Heizelement für die selbstregelnde Nachheizung der Zuluft. Die Luft wird in Abhängigkeit von Luftmenge und Lufteintrittstemperatur auf 40 bis 50°C erwärmt.

Hochschule Rosenheim University of Applied Sciences

Das PTC-Element wird in die Zuluftleitung eingebaut. Durch den abgesetzten Elektronik-Bereich ist eine nahezu wärmebrückenfreie Dämmung des Gehäuses möglich. Durch den Selbstregeleffekt von PTC-Elementen wird das Heizelement bei Ventilatorausfall nicht überhitzt.

any position in the room

- In general all conventional heating systems can be used in passivehouses Passivehouses have the advantage, that the heater can be installed in almost
- Recommendations:
 - Use fast responding systems like radiators
 - If a water system is used, the circulation pump should be controlled according to the heat demand
- Disadvantage of conventional heating systems: Probably more expensive
- Further advantage: Decoupling of heating power and supply air change rate, usefull when a low humidity load is expected

© Prof. Dr. Harald Krause

Room Heating Systems	
Aligning Room Temperatures in Dwellings	

Basic Questions:

- Room temperatures in "normal" dwellings
- Lower temperatures in bedrooms
- Higher temperatures in bathrooms
- Rapid temperature changing
- Different temperatures in different rooms
- How to meet these demands ?
- Effects on energy consumption

Abbildung 1: Gemessene Temperaturen in 67 Wohnungen. Die Räume waren jeweils mit Heizkörpern und Thermostatventil ausgestattet. Grafik aus [Reiß 2003].

© Prof. Dr. Harald Krause

Room Heating Systems Lower Temperatures in Bedrooms

Hochschule Rosenheim University of Applied Sciences

Hochschule Rosenheim University of Applied Sciences

Applying dynamic simulation methods: Different possibilities to achieve lower temperatures in bedrooms were investigated:

- Window opened over night (tilted): 45 m³/h from 22 to 7
- Window opened over night in such a way, that temperature is between 16 and 18 °C
- Windows completly open for a short time before sleeping
- No heated supply air
- Night time heating reduction

Room Heating Systems Lower Temperatures in Bedrooms

Room Heating Systems Higher Temperatures in Bathrooms

Abbildung 18: Heizwärme- und Primärenergiebedarf für die Fälle, in denen im Bad höhere Temperaturen erreicht werden. Eine kontinuierliche Zusatzheizung im Bad sollte nicht direktelektrisch betrieben werden.

Heating Systems / 22

Room Heating Systems Recommendations

- Cool bedroom is achievable in a passivhouse:
 - □ Tilted window
 - Bedroom without supply air heating
 - Own experience: window tilted, closed supply air inlet
- Additional heating in bathrooms is necessary
 - Electrical powered: use temporarly
 - Non electrical heater: permanent heating to 24°C is possible
- Different temperatures in different rooms
 - One air heater for each floor
 - One air heater for a group of rooms
 - Use conventional room heating systems like radiators

- 1. Required Heating Power
- 2. Direct Electrical Heating (not recommended)
- 3. Compact Units with Heat Pumps
- 4. Boilers with Gas and Oil
